Framework Settings

When using a framework for a new project, it will be automatically detected. As a result, several project settings are automatically configured to achieve the best result. You can override them below.

Root Directory

The directory within your project, where your code is located. Leave this field empty if your code is not located in a subdirectory.

Include files outside the root directory in the [Build Step](#).

Enabled ☒

Skip deployments [when there are no changes to the root directory or its dependencies.](#)

Disabled ☐

On-Demand Concurrent Builds

Skip the build queue and build deployments immediately. Usage costs apply per build minute.

- ☐ **Run all builds immediately**
Skip the queue for all builds
- ☐ **Run up to one build per branch**
New deployments within a branch are queued
- ☒ **Disable on-demand concurrent builds**
Builds are queued, maximum of one at a time

This feature is available on the [Pro plan](#) [↗](#)

Build Machine

Choose a larger build machine. Charges apply per minute if it exceeds your team's pre-committed concurrency.

- ☒ **Standard performance** 4 vCPUs 8 GB Memory **Default**
Cost-effective option for lightweight apps and APIs

Enhanced performance 8 vCPUs 16 GB Memory

☐ Increased compute, ideal for large applications

☐ **Turbo performance** 30 vCPUs 60 GB Memory
Optimized for Turbopack builds which take advantage of multiple cores

Rolling Releases

Configure rolling release settings for your production environment. Rolling releases allow you to gradually deploy changes to users by defining a percentage of traffic for each stage.

☐ Disabled
